Verify your algorithm in an experiment on data it hasn't seen Once we

have selected the right outcome a final potential pitfall stems from how we measure success. The Bellman-Ford algorithm is an algorithm that computes shortest paths from a single source vertex to all of the other vertices in a weighted digraph It is slower than Dijkstra's algorithm for the same problem but more versatile as it is capable of handling graphs in which some of the edge weights are negative numbers.

I was in the same situation 1 and a half year ago I will explain how I learnt data structure and algorithms In the following text Algorithms and Data structure which are marked in bold are very important
